Snarl – Notifications (Project 10)

Installating Snarl

15.07.14

We are **Project-10** and we have extended **Snarl**, the notification service for Squeak, as part of the software engineering lecture at Hasso-Plattner-Intitute.

Now it's possible to **display the notifications outside of Squeak** - **have fun!**

Installing Snarl

(1) Get the git-repository.

(2) In Squeak, add a new filetree-repository and choose the folder 'packages'.

(3) Open the repository and install the packages **in this order**:

... on MacOs and Windows

   (1) FFI-Pools

   (2) FFI-Kernel

   (3) Project-10

... on Ubuntu

   (1) install Libnotify *

   (2) install the Squeak-Plugin CommandShell from SqueakSource **

   (3) Project-10

If you want to test the internal function of Snarl also load Project-10-Tests.

* for Ubuntu with 'sudo apt-get install libnotify-bin'

** http://www.squeaksource.com/@jaUIyKCBlxhrDdgy/sm1d2777

Using Snarl

After installing, check Snarl's class documentation to learn how to use it.

Working on Snarl

If you want to develop and improve our Snarl, we created some issues on https://github.com/SWTI2014/SWTI2014-Project-10 which we considered useful as some suggestions. External Resources like python-script for MacOS you find also there.
